

America can lead the world in AI without asking working people and communities to bear the costs of that leadership.

That's why I'm fighting for a nationwide data center moratorium until Congress establishes comprehensive rules governing the economic, environmental, and safety impacts of AI. And I'm proud to be the only candidate in this race to sign the AI Pact, which pledges a people-first approach to AI and accountability for the companies developing and deploying it.

We also cannot allow politicians to claim they support AI regulation while being bankrolled by Big Tech billionaires and corporate special interests.

Our country must invest in clean energy, modernize our electrical grid, support AI safety research, and ensure communities hosting AI infrastructure have a meaningful voice. We need strong protections for workers and consumers, including human oversight in high-risk sectors and a seat at the table for workers and unions.

Leadership means building the world's most innovative, safe, and sustainable AI ecosystem, with guardrails and support for working Americans.
